

WHAT YOU NEED TO LOOK FOR WHEN SELECTING YOUR FURNACE REPLACEMENT

The size, layout, insulation, and age of your home affect the size of the furnace that would best suit your space

The air flow capacity of your duct system impacts the temperature control and efficiency of energy of your home and furnace. Be sure to have this checked before replacing your furnace.

How well insulated is your home? A lack of proper insulation can result in your furnace working harder than need be, costing you more.

The size of a furnace matters too. Consult a licensed professional to determine what size of furnace will work best for you.

The number of windows your home affects the type of furnace your home should have as more windows may require a high capacity furnace.

Your air conditioning system directly impacts the efficiency of your furnace system.

What energy source does your home carry? Gas, propane or electricity can alter the selection of choices for your furnace replacement.

The wrong type of furnace can end up wasting more energy and costing you more money. A licensed professional can provide you with a suitable selection.
