

REASONS

WHY YOU SHOULDN'T
TURN OFF YOUR

FURNACE

Turning off your furnace in the winter can cause your water pipes to burst

Your furnace running can prevent the growth of mold in your home.

Turning your furnace on and off often will result in it working harder to warm up your home.

The costs of turning your furnace on and off run high due to the amount of energy it takes for your furnace to reach its operating efficiency.

Water pipes require a consistent source of heat to prevent freezing over.

Mold thrives in cool damp places in your home, therefore keeping your furnace running keeps your home warm and dry.

A programmable thermostat can help you control the heating in your home better than turning your furnace on and off.

Use a programmable thermostat to avoid this! You can control your heat without resorting to turning it off.
