

# How To Prolong The Life Of Your AIR CONDITIONER

## Clean Your AC Regularly

Just like other home appliances, your AC unit needs to be cleaned regularly. An outdoor AC unit is exposed to the elements like leaves in the fall, or ice in the winter. Because of this, you need to clean your AC of debris to prevent a breakdown.

## Change The Filter

An air conditioner has a filter to collect debris from the air. When the filter gets clogged, it causes your AC unit to work harder, which will decrease the lifespan. If you change the filter, your AC unit will work more efficiently and will save you money.

## Check For Leaks

To prevent your AC unit from breaking down, it is suggested that you check for leaks at least once per year. If you are not sure how to check for leaks, it's important that you get in contact with a professional.

## Make Sure AC Unit Is Installed Properly

If you were trying to save money by getting an unqualified person to install it, it might be time for you to call a professional, so they can ensure that your AC unit is correctly installed. A properly installed air conditioner means that you are less likely to have unforeseen damage or breakdowns.
