

5 WINTER ENERGY SAVING TIPS

WEATHERSTRIP YOUR DOORS & WINDOWS

Holes and spaces like doors and windows make your air conditioner or furnace work harder. Applying weather stripping is an easy solution to better insulate your home and decrease your energy bill. Plus, you can easily do it on your own.

INSTALL A SMART THERMOSTAT

A smart thermostat can fine-tune and optimize the operation of your furnace. You can program the thermostat to turn down the temperature while you're sleeping or away, and set it warmer just before you arrive at your home. This way you can reduce your electric bill in winter without sacrificing comfort.

SCHEDULE YEARLY CHECK-UP FOR YOUR HEATING SYSTEM

Having yearly check-ups will increase the lifespan of your system and lower your utility bills during winter. Also, it will help you detect problems early and save you the inconvenience and cost of a breakdown during the freezing winter.

ADJUST YOUR WATER HEATER'S TEMPERATURE

Today's energy efficient water heaters can help you conserve energy and reduce electricity bills. The Department of Energy recommends setting a water heater to 120 degrees to save on energy costs and prevent scalding.

KEEP SPACE NEAR AIR VENTS

If furniture or other items are blocking your heating vents, your furnace will be working harder than necessary. This can increase your electricity bills. Clearing space around your vents ensures that every room in your home is getting good circulation and your system is working efficiently.
