

5 WAYS TO SAVE ENERGY AT HOME & REDUCE UTILITY BILLS

Use energy-efficient appliances

1

Energy-efficient appliances consume less power and can save you a lot of money in the long run. When you're in the market for a new appliance, look for the Energy Star label, which indicates that the product meets strict energy efficiency guidelines.

Install a programmable thermostat

A programmable thermostat allows you to set the temperature of your home according to your schedule. You can set the temperature to be lower when you're not at home or sleeping, and higher when you're awake and active. This way your heating and cooling bills will be lower.

2

Seal air leaks

3

Air leaks can allow warm or cool air to escape your home, which can cause your heating and cooling systems to work harder than they need to. Seal air leaks around windows, doors, and other areas with weatherstripping or caulking.

Switch to LED light bulbs

LED light bulbs use up to 75% less energy than traditional incandescent bulbs and last up to 25 times longer. This means you'll save money on your energy bill and won't have to replace bulbs as often.

4

Reduce water consumption

5

Water heating can account for up to 25% of your energy bill. To reduce your water usage, fix leaks promptly, install low-flow showerheads and faucets, and consider installing a tankless water heater system.
